

(a) Spectral-Aligned Gate — WHEN to Skip

Filtered-distance gate: decides WHEN to compute.

DiT at $t + 1$ and t

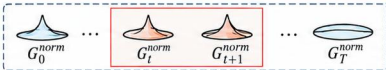

Hidden states
(residual features)

Spectral-Evolution-Aware Filters (Sec. 3.2)

Selected G^{norm} filters for $t + 1$ and t

Caching Rule (unified notation)

Skip if $\sum \Delta_t < \delta$ else Refresh

$$\Delta_t = \mathcal{L}_{1,rel}(P_{t+1}, P_t)$$

(b) Residual Chebyshev Forecaster — WHAT to Fill

Predict residuals with Chebyshev + Taylor and blend when skipped.
